1 @Backwater1D

1.1 Backwater1D

solve the gradually varied flow equation (backwater equation)
in one dimension

c.f. Chow, Bresse

1.2 backwater_approximation

approximation of the backwater curve by an exponential function
note: this is not necessarily a good approximation
in the case of tide, Q_t can be given

1.3 backwater_curve_iterative

analytic solution of the gradually varied flow equation
c.f. Bresse, Chow

1.4 backwater_length

backwater length

1.5 dh_dx

change of depth along channel for the backwater equation
beta : momentum coefficient
this is effectively an equation in h^3

1.6 dh_dx_

1.7 dzs_dx

change of surface elevation along channel

1.8 gvf_x_chow

analytical solution to the gradually varied flow equation (
backwater equation)
c.f. Chow, Bresse

1.9 invert

determine bed level from surface elevation
(inverse backwater equation)
this is ill conditioned, as the surface is smooth for subcritical
flow,
even if the bed is not smooth

C : chezy
W : width
Q : discharge
S : bed slope
y0 : surface elevation at outflow
lateral inflow

1.10 solve

solve the gradually varied flow equation (backwater equation)
C : chezy
W : width
Q : discharge
S : bed slope
y0 : surface elevation at outflow

1.11 solve_analytic

analytical solution to the gradually varied flow equation (bresse
method)
 $u_{\cdot}^{(n-m)}/(1-u_{\cdot}^n)$

1.12 solve_matrix

2 @Lateral_Diversion_Finite_Width

2.1 Jb

2.2 Lateral_Diversion_Finite_Width

2.3 dR

2.4 derive

2.5 evalk

2.6 `lateral_outflow_finite_width1`

2.7 `load_functions`

2.8 `stagnation_point`

```
fdx    = isnan(x);
```

2.9 `streamline`

2.10 `streamline_radius_of_curvature`

2.11 `u_far`

2.12 `v_far`

2.13 `velocity`

2.14 `velocity_near_bed`

3 @Lateral_Diversion_Wide_Channel

3.1 Lateral_Diversion_Wide_Channel

3.2 derive_lateral_outflow

derive potential flow solution to lateral outflow from an
infinitely
wide main channel

3.3 derive_lateral_outflow_finite_width

derive coefficients for lateral outflow in the case of potential
flow

3.4 lateral_outflow

potential flow solution to the case of lateral outflow from an
infinitely
wide channel

3.5 lateral_outflow_finite_width

analytical potential flow solution to lateral outflow from an
infinitely
wide channel

4 @Lateral_Diversion_Wide_Channel_Map

4.1 Lateral_Diversion_Wide_Channel_Map

wrapper to store precomputed streamlines of potential flows

4.2 streamline

5 @Potential_Flow

5.1 Potential_Flow

numerical solution of the potential flow on a curvilinear grid
(not necessarily curvilinear)

5.2 apply_boundary_potential_old

5.3 assemble_discretization_matrix_rectilinear

assemble the discretisation matrix

5.4 assemble_potential_matrix

assemble the discretisation matrix for potential flow

5.5 bc_dirichlet

apply Dirichlet boundary conditions

5.6 boundary_condition_side_outflow

apply boundary conditions for side outflow
 $p\phi + (1-p)d/db \phi = rhs$
y : along channel coordinate

5.7 boundary_condition_side_outflow_1

```
apply boundary conditions
p*phi + (1-p)*d/db phi = rhs
```

5.8 contour

contour plot of the potential flow solution

5.9 cut_boundary

```
cut the boundary from the domain
wa : width of inlet to side channel
wb : width of side channel
```

5.10 cut_rectangle

```
cut a rectangle from the domain
TODO, this requires also an adaptation of the derivative matrices
-> step over to semi-unstructured mesh
```

5.11 infer_bed_level

note: this is pretty much a broken function for the inference of
stationary
morphology

Missing:

- rolling down of transverse slope to balance secondary flow in bends
- quasi time steippong

at stationary state:

- changes of discharge along the streamlines of discharge are balanced
by a change in depth, to keep the velocity and sediment transport constant along the streamline

$$dz_b/dt = dq_s/dx + dq_s/dn = 0 \quad (i)$$

TODO this only true for infinite bends, as sediment can also move
 to the side
 $dqs/ds = d/s(q/h) = 1/h dq/ds - q/h^2 dh/ds = 0$
 TODO this is only true in an infinite bend (ikeda)
 $dqs/dn = 0$
 streamlines along discharge or velocity -> does not matter eq (i)
 is direction independent

5.12 infer_bed_level2

infer the bed level

5.13 infer_bed_level3

5.14 infer_bed_level_loop

the bed level does not completely converge but starts to oscillate,
 this is presumably due to the non-compact kernel implementation of
 the laplacian operator

5.15 objective_bed_level

objective function for determining the bed level

5.16 old

5.17 plot

surface plot

5.18 quiver

5.19 sediment_transport

compute the sediment transport

5.20 solve_potential

solve for the flow potential

5.21 streamline

compute a streamline

5.22 surface_elevation

compute surface elevation according to Bernoulli's law

5.23 test

5.24 velocity_near_bed

determine the velocity near the bed

5.25 vertical_velocity

determine the vertical velocity from continuity

6 @Potential_Flow_Analytic

6.1 Potential_Flow_Analytic

analytical solutions to various depth-averaged potential flow problems

6.2 streamline

numerically follow path along streamline by integrating the velocity

7 @SWE

7.1 SWE

Class to solve the (cross sectionally averaged) shallow water equation
(st venant equation)

7.2 bc_incoming_non_reflecting

set non-reflecting boundary condition for the 1D SWE

7.3 bc_inflow

inflow boundary condition

7.4 bc_inflow_low_pass

set low frequency Dirichlet, high frequency pass boundary condition

7.5 bc_inflow_non_reflecting

set non-reflecting boundary condition

7.6 bc_level

set surface level as Dirichlet boundary condition

7.7 bc_level_sommerfeld

set surface level as boundary condition by sommerfeld method

7.8 bc_nonreflecting

set non-reflecting boundary condition
extrapolate 0-order

7.9 bc_reflecting

set reflecting boundary condition
extrapolate 0-order and invert v

7.10 dot

time derivative
(only for matlab internal ode-solver)
TODO this is not swe specific
continuity
 $dA/dt + dQ/dx = I$

momentum
 $dQ/dt + d/dx(Qu + 1/2 gh^2) = gA(S_f - S_b)$
 $S_b = dz_b/dx$
 $S_f = \tau_x/\rho_w = C_f u|u|$

7.11 dt_cfl

determine time step required by cfl

7.12 energy

determine total energy as sump of potential and kinetic energy
this is preserved for fricitionless flows

7.13 flux

st venant's shallow water equation flux

7.14 flux_lin

linearised st-venant equation

7.15 fluxmateig

eigenvalues und vectors of the swe

7.16 jacobian

Jacobian of the SWE

$$\frac{dq}{dt} + J \frac{dq}{dx} = \text{sourceterm}$$

note: $\frac{d}{dx}(A*q) = J \frac{dq}{dx}$

7.17 lindot

linearised SWE

width variation not included, goes into rhs force term

$$\begin{bmatrix} 0, & 1 \\ -u^2+gH, & 2u \end{bmatrix} \begin{bmatrix} A \\ Q \end{bmatrix} = \begin{bmatrix} Q \\ [Q]_{dx} [Q^2/A+1/2gA^2/w]_{dx} - 1/2gA^2/w^2 dw/dx \end{bmatrix}$$

force term

7.18 roe_average

roe average for the SWE

7.19 solve_analytic

linearised analytic solution of the swe

7.20 solve_stationary

stationary solution to the SWE

7.21 source_bed_level

source term of the SWE caused by a change of the bed level

Note: this term causes splitting and averaging methods to fail to give accurate predictions of the smooth surface at steps of the bed

7.22 source_friction

friction source term of the SWE

7.23 source_width

source term (reaction term) for channels with variable width

7.24 swe_geometry

predefined functions to set up channel geometry

7.25 swe_ic

predefined functions of channel geometries

8 @SWE_2d

8.1 SWE_2d

Dynamic solution of the shallow water equation (depth average, 2D)

8.2 `apply_boundary_condition_stationary`

apply boundary condition for stationary flow

8.3 `assemble_stationary`

TODO, `g` should be replaced by `gx,gy,gz`, see `chaudhri`
assemble discretisation matrix for stationary flow

8.4 `solve_stationary`

solve SWE for stationary flow ($dU/dt = dQ/dt = 0$)

9 `@Side_Weir`

9.1 `Side_Weir`

side weir, analytical solution to (critical) lateral outflow

9.2 `dzs_dx`

side weir, along channel surface gradient

9.3 `surface_elevation`

along-channel surface elevation for (critical) lateral outflow over
a side-weir

10 `open-channel-flow`

functions for open channel flow, sub modules:

`@Backwater1D`

gradually varied flow in 1D (backwater)

`@Potential_Flow`

depth averaged potential flow, numerical solution
 @Potential_Flow_Analytic
 depth averaged potential flow, analytical solution
 rating-curve
 empirical rating curves
 @Side_Weir
 analytical solution to lateral outflow over a side weir
 @SWE
 dynamical solution of the shallow water equation (saint-
 venant-equation)
 in 1D
 @SWE_2d
 dynamical solution of the shallow water equation (saint-
 venant-equation)
 in 2D
 velocity-profile
 vertical and transverse velocity profiles of the streamwise
 velocity

10.1 Lateral_Diversion_Finite_Width_Map

10.2 chezy2manning

10.3 chezy2z0

10.4 diffusion_wave

propagation of a diffusion wave (flood wave), c.f. ponce
 advection
 diffusion
 where is the bed slope?
 friction slope
 eddy slope
 chow 1988

$$d(A+A_0)/dt + dQ/dx = q$$

$$dQ/dt + d/dx \beta Q^2/A + gA(dh/dx + S_f + S_e) - \beta q_i v_i + W_f B = 0$$
 A0 ignored
 inflow and wind shear ignored

10.5 friction_slope

friction slope (surface slope) for uniform stationary flow

10.6 linear_wave

linear wave routing (linearised kinematic wave)

10.7 manning2chezy

10.8 manning2drag

10.9 manning2z0

11 meander-bend/@Equilibrium_Bend

11.1 Equilibrium_Bend

Transverse profile of the bed level and bed material grain size in an equilibrium (infintely long) meander bend

11.2 bed_profile

predict transverse bed profile of an equilibrium meander bend

11.3 bed_profile_uniform

transverse profile of the bed level of an equilibrium meander bend with uniform grain size

11.4 calibrate

calibrate bend geometry to given profile

11.5 dD_dr

11.6 dh_dr

across channel derivative of flow depth for a meandering river

11.7 dh_dr_uniform

transverse gradient of the bed level of an equilibrium meander bend for the case of uniform bed material

11.8 grain_size_profile

transverse (across channel) profile of the bed material grain size in a river meander

12 meander-bend

12.1 Kinoshita

```
% Public properties
% Public get properties
% Private properties
% Constructor
% Setters and getters
% generic methods
```

12.2 bend_transverse_velocity

transverse velocity profile in a meander bend

12.3 bend_velocity_near_bed

near-bed-velocity in a meander bend

12.4 kinoshita_

12.5 random_meander

generate a pseudo random meander

12.6 test_rozovskii

13 old

13.1 UniformFlow

14 rating-curve

14.1 ChezyRatingCurve

rating curve, Chezy formalism

14.2 DynamicKeuleganRC

Dynamic Rating Curve, Keulegan roughness formulation
(dynamic = correction for hysteresis loop)

14.3 DynamicManningRC

Dynamic Rating Curve, Manning roughness formulation
(dynamic = correction for hysteresis loop)

14.4 DynamicPowerRC

Dynamic Power Law Rating curve
(dynamic = correction for hysteresis loop)

14.5 KeuleganRatingCurve

14.6 ManningRatingCurve

14.7 PolyRatingCurve

14.8 PowerRatingCurve

stationary rating curve, power law

14.9 PowerRatingCurveOffset

stationary rating curve, stage-discharge follows power law

14.10 RatingCurve

Fri Feb 13 10:02:52 CET 2015
rating curve superclass

14.11 csarea

predict cross sectional area from transverse bed level profile
and surface elevation

14.12 csdischarge

compute discharge

14.13 csperimeter

compute wetted perimeter

14.14 csradius

compute hydraulic radius of the cross section

14.15 cswidth

determine cross section width

14.16 test_PowerRatingCurve

14.17 wfunc

determine channel width

15 open-channel-flow

functions for open channel flow, sub modules:

- @Backwater1D
 - gradually varied flow in 1D (backwater)
- @Potential_Flow
 - depth averaged potential flow, numerical solution
- @Potential_Flow_Analytic
 - depth averaged potential flow, analytical solution
- rating-curve
 - empirical rating curves
- @Side_Weir
 - analytical solution to lateral outflow over a side weir
- @SWE
 - dynamical solution of the shallow water equation (saint-venant-equation)
 - in 1D
- @SWE_2d
 - dynamical solution of the shallow water equation (saint-venant-equation)
 - in 2D
- velocity-profile
 - vertical and transverse velocity profiles of the streamwise velocity

15.1 shear_velocity

15.2 surface_slope

surface slope for uniform stationary flow

15.3 sw_reflection

reflection coefficients of shallow water waves at a sudden change of the cross section (sudden change of admittance)
c.f. lighthill, ippen-harleman

15.4 sw_reflection_stepwise

time passes and phase shifts
transmission and reflection coefficient depend on direction !
iterative (recursive) reflection and transmission

16 test/test_Backwater1D

16.1 test_bw1d_solve_matrix

17 open-channel-flow

functions for open channel flow, sub modules:

- @Backwater1D
 - gradually varied flow in 1D (backwater)
- @Potential_Flow
 - depth averaged potential flow, numerical solution
- @Potential_Flow_Analytic
 - depth averaged potential flow, analytical solution
- rating-curve
 - empirical rating curves
- @Side_Weir
 - analytical solution to lateral outflow over a side weir
- @SWE
 - dynamical solution of the shallow water equation (saint-venant-equation)
in 1D
- @SWE_2d
 - dynamical solution of the shallow water equation (saint-venant-equation)
in 2D
- velocity-profile
 - vertical and transverse velocity profiles of the streamwise velocity

17.1 test_inverse_backwater_curve

17.2 test_normal_flow

17.3 test_nse_nz

18 uniform-stationary-flow

18.1 chezy2drag

18.2 critical_flow_depth

critical flow depth in uniform stationary flow

18.3 drag2chezy

convert drag coefficient to chezy coefficient
 $g \frac{dz_s}{dx} + c_d w \frac{u^2}{h} = 0$ (swe formalism)
 $- S + \frac{1}{C^2} \frac{U^2}{H} = 0$ (chezy formalism)

18.4 normal_flow_depth

normal flow depth for uniform stationary flow
function $H = \text{normal_flow_depth}(Q, W, C, S)$

18.5 normal_flow_depth_

normal flow depth in uniform stationary flow

18.6 normal_flow_discharge

normal flow discharge for uniform stationary flow

18.7 normal_flow_slope

normal flow slope in uniform stationary flow

18.8 normal_flow_velocity

normal flow velocity in uniform stationary flow

18.9 normal_shear_velocity

19 velocity-profile/@Log_profile

19.1 Log_profile

logarithmic profile of the streamwise velocity

19.2 df_dh

sensitivity of profile with respect to depth

19.3 df_dh_

sensitivity of profile with respect to depth

19.4 df_dln_z0

sensitivity of velocity profile with respect to roughness length

19.5 df_dln_z0_

sensitivity of profile with respect to roughness length

19.6 profile

vertical profile of the streamwise velocity

19.7 profile_

scale of velocity at instrument depth to depth average velocity
roughness length and associated standard error can change in time,
i.e. may be passed as vectors

```
zs      : [1xn] water surface level
zb      : [1x1] bottom level
za      : [1xn] or [1x1]
           level of velocity measurement,
           i.e. level of HADCP beam bin centre, coincides with
           instrument level,
           if the HADCP is horizontally aligned
           only needs to be passed as vector if instrument is
           redeployed or
           becomes misaligned
ln_z0   : [1xn] or [1x1]
           natural logarithm of the roughness length
s       : [1xn] or [1x1]
           standard error of ln_z0
function [fz_mu fz_s fz_sp fz_bias fz_eps] = log_profile(zs,zb,za,
ln_z0,s,sp,e)
```

19.8 profile_bias

19.9 regmtx

regression matrix

19.10 ubar

depth averaged velocity

20 velocity-profile/@Log_profile_with_bend_correction

20.1 Log_profile_with_bend_correction

vertical velocity profile corrected for bend flow

20.2 df_dc

sensitivity of the velocity profile with respect to the bend
correction
parameter c

20.3 df_dc_

20.4 du_dz

20.5 fit

fit the vertical velocity profile

20.6 profile_

vertical velocity profile

20.7 regmtx

regression matrix

20.8 u

streamwise velocity

20.9 u_

streamwise velocity

21 velocity-profile/@Log_profile_with_cubic_wake

21.1 Log_profile_with_cubic_wake

log profile with cubic wake

21.2 df_dc

sensitivity of profile with respect to wave parameter

21.3 df_dc_

sensitivity of profile with respect to wake parameter

21.4 profile_

vertical velocity profile

21.5 regmtx

regression matrix

22 velocity-profile/@Log_profile_with_dip

22.1 Log_profile_with_dip

Logarithmic profile with dip

22.2 fit

fit the vertical velocity profile

23 velocity-profile/@Log_profile_with_linear_bend_correction

23.1 Log_profile_with_linear_bend_correction

log profile with linear bend correction

23.2 df_dc

sensitivity of profile with respect to wake parameter

23.3 df_dc_

sensitivity of velocity profile with respect to wave parameter

23.4 du_dz

velocity shear along vertical

23.5 profile_

velocity profile

23.6 regmtx

regression matrix

24 velocity-profile/@Log_profile_with_wake

24.1 Log_profile_with_wake

logarithmic velocity profile with wake correction
c.f. coles

24.2 df_dc

sensitivity of profile with respect to wake parameter

24.3 df_dc_

sensitivity of velocity profile with respect to wake parameter

24.4 du_dz

velocity shear

24.5 profile_

predict velocity profile

24.6 regmtx

log law with wake

$$u = u_s/k \ln(z) - u_s/k \ln(z_0) + u_s/k (2/H^2 z - 3/H^3 z^2)$$

25 velocity-profile/@VP

25.1 VP

velocity profile

25.2 process_joint

25.3 process_transverse_profile

process the transverse velocity profile

25.4 process_vertical_profile

predict vertical profile error distribution parameter for HADCP
error estimate

25.5 profile_prediction_error

```
input :
U      : [nbin x nens]
        - values for each bin (or across section) and ensemble (or
          reference measurement)
        this are estimates estimates of the discharge or the cross
          sectional averaged
          velocity from the raw values
        - the profile should be limited to the effective profiling
          range,
          abobj 75-100m for a 600kHz ADCP

dn      : distance between HADCP bins
width   : cross section width

objput:
        sd_n : expected standard deviation for increasing profiling
              range
function [s_rel s_err s_dat rho res m2 u_pred fdx] =
        velocity_variation(U)
        hadcp_prediction_error
        TODO take scales and unscaled velocity to do combine with harmmean
          estimate
note: previous versions:
        residual was computed with respect to the predicted local
          velocity
        mse was not upscaled to cs, as profile was expected to cover
          entire cs
        finite width of cs was not considered
parametric estimate from moments, objliers should be filtered
        beforehand
Note that the median absolute deviation is not a good estimate,
because it may excludes rare events like reverse flow of floods
thus, the only acceptable more robust estimate would be mean
        absolute deviation
```

26 velocity-profile/@Vertical_profile

26.1 Vertical_profile

vertical profile of the streamwise velocity, superclass

26.2 fit

fit vertical velocity profile parameter

function obj = fit(obj,U,S,h,binmask)

26.3 u

predict velocity along the vertical based on profile

27 velocity-profile

27.1 fit_displacement_profile

fit the log profile to the vertical profile of the streamwise velocity

27.2 lateral_division_method

transverse (across channel) profile of the streamwise velocity
in a straight channel
numerical solution
the eps seems incorrect, use better stationary_1d_swe

$$\rho g h S - \beta q^2 f / (8 h^2) + d/dy(\epsilon_{s,t} dq/dy) = 0$$
$$\rho g h S - \beta q^2 g / (C^2 h^2) + d/dy(\epsilon_{s,t} dq/dy) = 0$$

27.3 test_law_of_the_wall_fit

27.4 transverse_profile_parameter

27.5 transverse_velocity_profile

transverse profile of the streamwise velocity
c.f. shiono knight

27.6 transverse_velocity_profile_olesen

transverse profile of the streamwise velocity in a meander bend

27.7 transverse_velocity_profile_rozovskii

transversal velocity distribution in a bend
Rososkii,
as in the book central differences along the radius and euler
forward in space
are used, note that since the advent of the computer more advanced
schemes
could be used (see build in solvers)
cfl condition is not explicitly checked
Rosovsky assumes a constant water level, e.g. does not consider
superelevation

$I_{\theta} = -1/r \, dz/d_{\theta}$ (p. 22)
 $d_{\theta} = 1/R \, ds|_R$
 $\Rightarrow I_{\theta} = -R/r \, dz/ds = -R/r \, I_0$
It : (1.32) drop of level per unit angle, identical across section

27.8 transverse_velocity_profile_shiono_knight

transverse profile of the streamwise velocity, determined
analytically
by the method of shiono and knight
shape of velocity profile only dependent on λ , f , H , not slope

27.9 transverse_velocity_profile_tidal_channel

27.10 transverse_velocity_profile_with_slope

stationary 1D shallow water equation across a river section
 $0 = -g h S_0 - \tau_b/\rho + d/dn (nu h du/dn)$
 $0 = -g h S_0 + g u^2/C^2 + d/dn (nu h du/dn)$
includes tranverse gradient term

note that shiono/knight 1991 provide an `_analytic_` solution,
which takes the form of an exponentially decaying side wall effect

27.11 vertical_profile_of_velocity_vriend

vertical profile of the streamwise velocity, method of de vriend

27.12 vertical_velocity_profile

vertical profile of the streamwise velocity in non-uniform flow

27.13 z2s_rational

28 wrapper

28.1 discharge2stage

wrapper function

28.2 stage2discharge

29 open-channel-flow

functions for open channel flow, sub modules:

- @Backwater1D
 - gradually varied flow in 1D (backwater)
- @Potential_Flow
 - depth averaged potential flow, numerical solution
- @Potential_Flow_Analytic
 - depth averaged potential flow, analytical solution
- rating-curve
 - empirical rating curves
- @Side_Weir
 - analytical solution to lateral outflow over a side weir
- @SWE
 - dynamical solution of the shallow water equation (saint-venant-equation)
 - in 1D
- @SWE_2d
 - dynamical solution of the shallow water equation (saint-venant-equation)
 - in 2D
- velocity-profile
 - vertical and transverse velocity profiles of the streamwise velocity

29.1 z0tochezy
